

The Countdown is On

Upgrade Your Heating System Before Program Changes on January 1, 2025.

Replace your heating system **before December 31, 2024**, to take advantage of current energy-efficiency rebates from SAVEGREEN[®] by New Jersey Natural Gas (NJNG). Rebates to replace your existing condensing furnace or boiler with a new, high-efficiency condensing model are available only for a limited time.

Effective **January 1, 2025**, rebates will only apply for the replacement of inefficient non-condensing models with new, high-efficiency condensing models.

Determining if your system is eligible for a rebate. If your current model looks like this...

Replacement of Existing Condensing Equipment

Not eligible for rebate after January 1, 2025.

How they work: A condensing furnace runs the exhaust gases through a secondary heat exchanger to extract the heat that would normally go through the chimney, and uses those gases to heat the building instead; gas temperature can be in the 100 degree range.

Specifications: Systems with white PVC, CPVC, Polypropylene or Stainless Steel, Category II or IV flue venting.

Replacement of Existing Non-condensing Equipment

Eligible for rebate after January 1, 2025.

How they work: Non-condensing systems run the exhaust gasses through a natural draft metal flue system at very high temperatures; gas temperatures can be in the 500 degree range.

Specifications: Systems that are standard or mid-efficiency (Category I or III) with flue venting made of galvanized metal.
